

## ***Indoor Range Rebuild 2022***

The roof over the target room at the indoor range collapsed during a heavy rainstorm. Emergency repairs were carried out. It was evident that the indoor range of our club needed more than just a patch up. We decided to have a new roof over the whole range installed. In this process asbestos was found in the ceiling and some tiles. This all was removed and the washrooms rebuilt to be handicap accessible and modernized. The floor in the back part replaced and all the old paint and other things disposed off. We now have room for targets with marks compressor to turn the targets and room for tables and chairs in the very back. This area was regularly flooded and is now clean and with the drainage outside the building improved also dry. The drainage will need to be improved in a permanent way a bit later. The work was carried out by some volunteers and we hired a contractor to build the roof and some interior work.

The roof design was altered to include the former flat roof over the target room into the roof line with a pitch to promote runoff from the roof and to discourage squatters from using the flat roof as a porch. The roofer used our indoor range for a workshop to pre cut all the panels. The old roof got removed and new sealing film was installed. The roof wooden structure was inspected and found in good condition. Also the insulation above the sealing was inspected and found dry and safe to be left in place. The roofing material is a different design then the old one and has all the screws hidden under seams so not to produce holes in the new roof. We also minimized the holes required in the roof to plumbing breathers only. We removed the hood from the kitchen and with it the large leaking duct for the vent.

All outside trim wood was replaced and the new wood covered with roofing metal
